EDUCATION

CIIT College of Innovation and Integrated Technology

Bachelor of Science in Computer Science

Quezon City, Metro Manila

08/2024 – Present

- Cumulative **GPA**: 3.70/4.00

CIIT Senior High School

ICT Programming

Quezon City, Metro Manila

08/2022 – 06/2024

- Research and Innovation Award (June 2024)

SKILLS

Languages:	HTML, CSS, JavaScript, Dart, Java, C++, C#, PHP, SQL, Python
Frameworks & Tools:	Flutter, Firebase, Three.js, Git/GitHub, Flask, NetBeans, VS Code, Android Studio
Hardware & Systems:	PC Building (SFF), Local AI Environments (Ollama, LM Studio), Raspberry Pi / IoT

PROJECTS & EXPERIENCE

AnonyMask Studio | CIIT Hackathon Jam 2026

- Awards:** 1st Place Best Overall Project & Most Innovative Solution
- Engineered the backend logic for an interactive 3D mental health web app using **Vanilla JavaScript and Three.js**, collaborating in a 5-person agile team to deploy a fully functional prototype within a strict 48-hour window.
- Developed a real-time visual emotion analyzer that extracts pixel data from an HTML5 Canvas, calculates color distances, and quantifies user brushstrokes into actionable emotional metrics.
- Designed a client-side NoSQL data structure via the LocalStorage API to securely serialize journal entries (base64 images and metadata) while ensuring user privacy.
- Implemented a "Pattern-Based Distress Alert System" utilizing historical state management to track consecutive negative entries and automatically trigger crisis interventions.

TelemetryPi: Hardware Monitoring System | Operating Systems Capstone

- Award:** Special Participation Award
- Engineered a full-stack telemetry hub using **Python, Flask, and a Raspberry Pi Zero W** to track real-time PC performance across a local network with zero host overhead.
- Architected a firewall-bypassing "Push" REST API with mDNS resolution, enabling Windows clients to securely transmit JSON payloads without inbound port forwarding.
- Resolved Out-Of-Memory crashes on 512MB ARM hardware by configuring a Linux Virtual Swap File and optimizing the frontend Chart.js rendering pipeline.
- Deployed a frictionless, zero-install Windows agent by compiling the Python scripts into standalone executables via PyInstaller and Batch scripting.

Foodika: B2B/B2C Mobile Retail Application | Flutter & Firebase

- Engineered a dual-sided food discovery and loyalty application using **Flutter, Dart, and a serverless Firebase architecture** (Firestore, Auth, Storage).
- Developed a real-time, closed-loop point economy with automated transaction rollbacks, utilizing **StreamBuilder** to instantly sync live order states between B2C users and the B2B kitchen dashboard.
- Built a B2B analytics dashboard that dynamically aggregates anonymized customer data, mapping birthdates to specific age demographics to provide merchants with actionable marketing insights.
- Optimized cloud architecture to utilize open-source mapping (**flutter_map**) and free-tier NoSQL databases, minimizing deployment overhead for a bootstrapped market launch.
